

Edge Retention

Sureguard Window Films® offer a range of edge retention and glass anchoring systems, that when used in conjunction with our Safety Security and Bomb Blast Window Films offer additional protection against flying or falling glass.

Our range of Anti-Shatter Window Films, combined with anchoring is designed to capture and absorb any shock and bonds glass together until the glass can be replaced. The systems are regularly used on:

- overhead glass and in buildings where additional bomb blast protection is required.
- and for containment and protection for fall arrest.

Below are details of various Glass Anchoring Systems to suit various frame types that are cost effective and provide peace of mind, ensuring Risk Management & Health & Safety are maintained.

Enhancing the performance of existing glass

There are 2 main types of Edge Retention:

1. Structural
2. Mechanical

Depending on your frame/glazing system, we can specify the best solution to meet your requirements, meaning in the event of a breakage, personal injury is dramatically reduced enabling the removal of broken glass from the frame for replacement minimising the need for ‘boarding up’, and down time.
